

FeatureList xText EBNF new version:

-Core Features:

-BNF front-end (Parser, Lexer, Linker, etc.) - translates a textual representation into an Ecore model

-the editor

- Editor - provides IDE features, e.g. auto-completion, syntax highlighting, etc.

-Validation Rules: these rules will give warnings in the editor if they find inconsistencies in the code

-checkUpdateGrammarConsistency: checks, if the grammar is an updated grammar, for inconsistencies between the originals and the new grammar

e.g.: status: not migrated

-CheckReferencedOnlyOnce?: this should warn if there is a rule that is only referenced once, this is an inlining hint

e.g.: status: migrated

-checkPassthroughRule:

e.g.: this tests if a rule gets just passed through

$a ::= b \mid b ::= \text{"literal"} \iff a ::= \text{"literal"}$, which is better for EBNF

-checkEqualAlternative: this tests if a rule got equal alternatives

e.g.:

$a ::= d \mid d$

status: still some problems

-checkDuplicateRules: checks if there is another rule in the EtsiBnf?, that got the same behaviour

e.g.:

$a ::= \text{"literal"} \mid b \mid c ::= \text{"literal"} \mid b$

status: migrated

-checkSubruleDuplicates:

status: not migrated

-check unused rule: it checks if a rule is used (except for the rule with the number 1)

status: migrated

-checkNameIsUnique: checks if the name of a rule is already in use

e.g.:

```
a ::= "end" a ::= "fin"
```

status: migrated

-Generation:

-basic generation has been achieved but the output-format is unclear. Works with a Xtend-generator, momentary "xmi-like" output for a bnf grammar -old version had: mwe2 Generator and Xpand2 support

- it could generate mergeGrammars from CoreGrammars? and CompositeGrammars? from Merge grammars -seemingly it could produce a xsl-fo-file with the corresponding nodemodel

-new version: xsl-fo file for all bnf grammars (not for merge or deltagrammars) this can be Rendered to Pdf using apache-fop

-Formatting:

-old: had some but they are got commented out in the main project

-new: Line-break after every rule, white-spaces after all literals, linebreak and double tab after all >|< bars

-still got some Problems with rulereferences at the end of a definitionlist

-Refactoring & Quickfixing:

old had: -auto Numbering of rules

-not migrated

-remove unused rules

-not migrated

-replacement of passthroughRules

-not migrated

-refactor uppercasetokenRules

-not migrated

-find references, this one is standard in xtext2.* -renaming, this is standard in xtext2.*

-Grammar composition:

-3 grammartypes:

grammar: normal grammar
delta grammar: different notation for a extension grammar,

adds new rules to a grammar (regular rules) and adds changes to rules of the extended grammar (extension rules) - can be automatically created

merge grammar: for merging extensions

-old version had an automatic composition Process, for merge grammars, with a small pop-up-menu.

- at the moment no support in the new version

-Deploying:

-export project: Plug-in Development/deployable plug-ins and fragments -rcp project with a minimal eclipse editor
