FeatureList xText EBNF Version 2.0

- **Core Features**:

1. BNF front-end (Parser, Lexer, Linker, etc.)
2. translates a textual representation into an Ecore model
3. Editor - provides IDE features, e\.g\. auto-completion, syntax highlighting, etc.

- **Validation Rules:** these rules will give warnings in the editor if they find find consistencies in the code

1. *checkUpdateGrammarConsistency:* checks, if the grammar is an updated grammar, for consistencies between the originals and the new grammar

   status: not migrated

2. *!CheckReferencedOnlyOnce:* this should warn if there is a rule that is only referenced once, this is an inlining hint e.g.:

   status: migrated

3. *checkPassthroughRule:* e.g.:this tests if a rule gets just passed through a ::= b b ::= "literal" <=> a ::= "literal" , which is better for EBNF

   status: migrated

4. *checkEqualAlternative:* this tests if a rule got equal alternatives e.g.: a::= d | d status: still some problems

   status: migrated

5. *checkDuplicateRules:* checks if there is another rule in the EtsiBnf?, that got the same behaviour e.g.: a ::= "literal" | b c ::= "literal" | b

   status: migrated

6. *checkSubruleDuplicates:*

      status: not migrated

7. *check unused rule:* it checks if a rule is used (exept for the rule with the number 1)

      status: migrated

8. *checkNameIsUnique:* checks if the nam of a rule is already in use e.g.: a ::= "end" a ::= "fin"

      status: migrated

- **Generation:**

   xsl-fo file for all bnf grammars (not for merge or deltagrammars) this can be Rendered to Pdf using

apache-fop

- **Formatting:**

  old: had some but they are got commented out in the main project

  new: Line-break after every rule, white-spaces after all literals, possible update linebreak and double tab after all >|< bars

- **Refactoring & Quickfixing:**

1. *auto Numbering of rules*
   -not migrated
2. *remove unused rules*
   -migrated
3. *replacement of passthroughRules*
   -not migrated
4. *refactor uppercasetokenRules*
   -not migrated
5. *find references* , this one is standard in xtext2.* -renaming, this is standard in xtext2.*

   *Grammar composition:

   -3 grammartypes:

   grammar: normal grammar deltagrammar: different notation for a extension grammar,

   adds new rules to a grammar (regular rules)and adds changes to rules of the extended grammar(extension rules) -can be automaticly created

   mergegrammar: for merging extensions

   -old version had an automatic composition Process, for merge grammars, with a small pop-up-menu.

- at the moment no support in the new version

- **Deploying:**

  export project as Plugin: Plug-in Development/deployable plug-ins and fragments -rcp project with a minimal eclipse editor
