FeatureList xText EBNF Version 2.0

Core Features:

- 1. BNF front-end (Parser, Lexer, Linker, etc.)
- 2. translates a textual representation into an Ecore model
- 3. Editor provides IDE features, e.g. auto-completion, syntax highlighting, etc.

Validation Rules:

These rules will give warnings in the editor if they find find consistencies in the code.

- 1. *checkUpdateGrammarConsistency:* checks, if the grammar is an updated grammar, for consistencies between the originals and the new grammar status: not migrated
- 2. *checkReferencedOnlyOnce*: this should warn if there is a rule that is only referenced once, this is an inlining hint e.g.: status: migrated
- 3. *checkPassthroughRule:* e.g.:this tests if a rule gets just passed through a ::= b b ::= "literal" <=> a ::= "literal", which is better for EBNF status: migrated
- 4. *checkEqualAlternative*: this tests if a rule got equal alternatives e.g.: a::= d | d status: still some problems status: migrated
- 5. *checkDuplicateRules*: checks if there is another rule in the EtsiBnf?, that got the same behaviour e.g.: a ::= "literal" | b c ::= "literal" | b status: migrated
- 6. checkSubruleDuplicates:

status: not migrated

7. check unused rule: it checks if a rule is used (exept for the rule with the number 1)

status: migrated

8. checkNameIsUnique: checks if the nam of a rule is already in use e.g.: a ::= "end" a ::= "fin"

status: migrated

Generation:

Generating an intermediate xsl-fo representation for all BNF grammars (merge or delta grammars not supported). This can be rendered to PDF using apache-fop

status: in progress

Formatting:

- old: had some but they are got commented out in the main project
- *new:* line-break after every rule, white-spaces after all literals, possible update linebreak and double tab after all >|< bars

Refactoring and Quick-fixing:

Automated restructuring support.

- 1. auto Numbering of rules
 - not migrated
- 2. remove unused rules
 - migrated
- 3. replacement of passthroughRules
 - not migrated
- 4. refactor uppercasetokenRules
 - not migrated
- 5. find references provided by xtext2
- 6. renaming provided by xtext2

Grammar Composition:

- 3 grammartypes:
 - ♦ grammar: normal grammar
 - delta grammar: different notation for a extension grammar,
 - ♦ adds new rules to a grammar (regular rules) and adds changes to rules of the extended grammar (extension rules) (can be automatically created)
 - ♦ merge grammar: for merging extensions
- old version had an automatic composition process for merge grammars with a small pop-up-menu.
- at the moment no support in the new version

Deployment:

- export project as Plugin: Plug-in Development/deployable plug-ins and fragments
- RCP project with a minimal eclipse editor: TBD

Formatting: 2
